DT PLAYBOOK

1	Duration of Each Phase	Time to complete the project _____
2		Problem Identification: 1300 + unicorns in the world / Y Combinators / Gen AI Elements
3		Project Checklist + User Empathy
4		Create cloning using FSD / LCNC, Team Management Guidance from CF
5		Pitch among peers Customer Sales Pitch (Online/ Physical)
6		BMC Analysis Pitch Deck Preparation
7		Pitch with Mentors/ Industry/ Alumni/ SNS 15

DT PLAYBOOK

8		Brand the Impact with Story in LinkedIn/ y tube using CGC Preparte a Casebooklet Update their Profile: Resume, GitHub, LinkedIn etc.
9		Pitch with Guide/Mentor
10		Final Pitch
11	Post Bootcamp	Hackathon
		Patent/ Journal
		Startup / Revenue Generation

Project Checklist

Provide ✓ to the completed stages during submission:

Completed	
Empathize: Conduct user research to understand the needs, preferences, and pain points of your target audience.	
Create user personas based on your research findings	
Define: Clearly define the problem statement or opportunity you're addressing with your Product/ App.	
Use tools like problem statements and opportunity maps to articulate this.	
Ideate: Brainstorm potential solutions to the defined problem.	
Encourage creativity and generate a wide range of ideas through techniques like brainstorming sessions or mind mapping.	
Prototype: Develop prototypes or mockups of your product/app ideas.	
Start with low-fidelity prototypes to quickly iterate and gather feedback before investing in high-fidelity prototypes.	

Project Checklist

Test: • Conduct user testing to gather feedback on your prototypes.	
	• Use feedback to refine and improve your product/app design iteratively.
Iterate: • Continuously refine and iterate on your Product/ App design based on user feedback and testing results.	
	• Embrace a mindset of continuous improvement throughout the development process.
Plan: • Develop a project plan outlining the key milestones, tasks, and timelines for each stage of the development process.	
	• Assign responsibilities to team members and allocate resources effectively.
Execute: • Implement the project plan, keeping track of progress and addressing any challenges or obstacles that arise.	
	• Regularly communicate with stakeholders to ensure alignment and transparency.
Evaluate: • Assess the effectiveness of your product/ app design and development process.	
	• Gather feedback from users, stakeholders, and team members to identify areas for improvement.

Welcome

Great products start with great ideas. Your product/ app design journal will guide you as you empathize, define, plan, prototype, and evaluate your own product/ app idea to build something you care about.

Overview

Products/ Apps can be purely entertaining, and they can also help people discover new ideas, solve problems, connect with others, or create something amazing.

The brainstorming stage allows you to identify problems and come up with possible solutions. This section includes a few key topics for you to think through. Some topics have optional Go Further activities if you're interested in exploring more. Jot down as many ideas, notes and sketches that can help you design your ideas for solving a problem in your school or college.

Empathize & Define

Purpose
Ideas
Audience
Focus

Define the opportunity, problem, or challenge

Think about things that you or others experience that you might want to improve, personalize, or just make more fun.

1. Brainstorm a list of opportunities, problems, or challenges you care about.

- Supplier delivery delays / frequent postponements
- Supplier quality issues and rejections
- Material shortages affecting production
- Unreliable supplier performance
- Difficult and time-consuming quotation comparison
- Scattered supplier and procurement data
- Lack of real-time visibility into supplier risks
- Difficulty in analyzing multiple risk signals together
- Late identification of supplier risks
- Lack of proactive recommendations for action

2. Choose the most interesting idea from your list and try to explain it in just one sentence.

Help businesses proactively identify and predict emerging supplier risks before they cause delivery delays, quality issues, material shortages or supply chain disruptions.

3. What do you know about the opportunity, problem, or challenge? What do you need to learn more about?

What we know:

- Supplier risks are influenced by delivery, quality, lead time, quantity, capacity, price and historical performance.
- Manual analysis is time-consuming and often identifies issues too late.
- Multiple data sources (inventory, orders, supplier history, market data) are available but not effectively combined.

What we need to learn:

- Which signals best indicate emerging supplier risks.
- How procurement teams currently identify and manage supplier risks in real-world scenarios.
- What additional external data (e.g., market conditions, supplier financial status) can improve accuracy.

4. Who cares about or is affected by this opportunity, problem, or challenge?

- **Procurement Managers** – make sourcing decisions and manage supplier risks.
- **Procurement Buyers** – collect quotations and interact with suppliers.
- **Suppliers** – provide quotations, deliver materials and communicate updates.
- **Finance / Approvers** – review and approve purchasing decisions.
- **Production / Operations Teams** – affected by material shortages and delivery delays.
- **End Customers** – ultimately impacted if supplier issues cause production or vehicle delivery delays.

Similar Products/ Apps

Think about the products/ apps that you use. Identify each product's/ app's purpose and why you use it. Which do you use most, and which did you stop using after just a few times? Why did you bought/ download them in the first place? Brainstorm a list of your favorite products/ apps, and identify their purposes and the features that make them good.

Product/ App purpose:

ERP for procurement and supplier management

I like this product/ app because .

- Centralized supplier and purchase data
- Reliable and widely used in industry
- Helps track orders, invoices and supplier performance

Product/ App purpose:

Spend management and procurement platform

I like this product/ app because .

- Easy supplier collaboration
- Good spend analytics and dashboards
- Streamlines sourcing and procurement processes

Product/ App purpose:

Data analysis and reporting

I like this product/ app because .

- Flexible and easy to use
- Helpful for quick analysis and charts
- Useful for tracking supplier data

Product/ App purpose:

Web browser for research and information

I like this product/ app because .

- Provides quick access to supplier news, market trends and industry reports
- Simple and fast
- Helps gather up-to-date information

Product/ App purpose:

Communication and collaboration

I like this product/ app because .

- Easy team communication
- Helps coordinate with suppliers and internal teams
- Keeps all discussions and files in one place

Use pen and paper to sketch out a mind map of the problems and possible solutions.

My ideas

Brainstorm and create a list of products/ apps you'd like to build and how they'd help address the opportunity, problem, or challenge you identified. For example, they might solve or improve a specific issue, add personalization to some situation, or just be something silly. Browse the App Store for app idea / Statista, Nielsen, SurveyMonkey, Google Trends etc. for product development for inspiration. Keep adding to this list and revisit it, as some ideas might become more interesting.

My product/ app idea

Smart Quotation Portal

- Suppliers can submit quotations via a standardized Excel/CSV template or upload PDF quotes (with OCR extraction).
- Automatically captures key details like unit price, MOQ, lead time, Incoterms and validity.
- Compares multiple quotes in a structured way.

AI Supplier Risk Dashboard

- Uses AI/ML to analyze delivery, quality, capacity, price and historical performance data.
- Provides a real-time risk score, risk type and explanation for each supplier.
- Alerts users about emerging risks (e.g., repeated delivery postponements).

Production & BOM Integration

- Integrates with production plan, BOM, inventory and incoming supply data.
- Calculates component requirements and predicts potential shortages.
- Maps suppliers to critical components (e.g., ECU) and monitors their delivery risk.

How my product/ app will help

- Saves time in collecting and standardizing supplier quotes.
- Reduces manual errors and improves data quality.
- Helps procurement quickly compare suppliers and make better decisions.
- Enables faster and more transparent negotiation.

- Helps identify supplier risks early before they cause production or vehicle delivery delays.
- Explains why a supplier is risky using key evidence.
- Allows procurement, operations and finance to take proactive action.
- Reduces material shortages and improves supply chain reliability.

- Provides real-time visibility of material requirements and inventory status.
- Flags potential component shortages based on supplier risk and production demand.
- Helps operations plan and take preventive actions.
- Supports uninterrupted production and on-time vehicle delivery.

Pitch Among Peers

Pitching with peers before developing a product/ app is crucial. Peers can provide valuable feedback on the concept, helping to refine and improve the idea before significant resources are invested in development. They might point out potential flaws, suggest enhancements, or offer different perspectives (can duplicate the content whenever needed).

Feedback and Refinement

- Got suggestions to simplify the UI and focus on key insights.
- Improved the idea based on feedback regarding data sources and use cases.

Collaboration and Support

- Team members suggested useful features like real-time alerts and supplier comparison.
- Received support and ideas from peers on implementation and datasets.

Validate the concept

- Peers found the ProcurAgent concept relevant and useful for the automotive industry.
- They confirmed the problem statement and target users are valid.

Help in Resource Identification

- Peers suggested open datasets, APIs and tools for supplier, production and market data.
- Shared references and learning resources for AI/ML integration.

Confidence Building

- Positive feedback from peers increased confidence in the idea.
- Encouragement to proceed with prototyping and testing.

Networking

- Gained connections with peers interested in similar domains (AI, supply chain, automotive).
- Opened opportunities for future collaboration and knowledge sharing.

Go Further

Do a little research on your initial top ideas. Do your product/ app ideas already exist? Don't be discouraged if you find one or several that are like the product/ app you have imagined. It just means and maybe now that you've seen a bunch of similar products/ apps, you can see ways to improve them.

For your favorite idea, find its top competitor on the online platform/ App store. Then check it out to answer the questions to the right.

My product's/ app's top competitor

Top Competitor

- A leading global procurement platform used by many automotive companies.
- Easy to use with wide supplier network.
- Strong features for sourcing and contract management.

Challenges while using the competitor

- Complex and expensive for small/medium businesses.
- Not focused on real-time supplier risk for production impact.
- Limited AI-driven insights for early disruption alerts.
- Steep learning curve for new users.

How could it be designed better?

- Provide simpler and more intuitive user experience.
- Focus more on real-time supplier risk and production impact (especially for automotive).
- Offer AI-powered insights and early warning alerts.
- Make it more affordable and scalable for different company sizes.
- Integrate BOM, inventory and production data seamlessly.

ProcurAgent aims to combine the strengths of existing platforms while focusing on AI-driven supplier risk intelligence for the automotive industry.

Reiterate

Explore products/ apps from different categories in the marketplace/ App Store. Take a look at the icons, screenshots and descriptions. Add example images here to keep track of your research.

5 It's important to design with a target audience. Who do you want to use your product / app?

- Procurement teams in automotive companies
- Production and inventory planners
- Operations and supply chain managers
- Management for risk and cost decisions
- Suppliers (for quotation submission and updates)

1 It's important to design with a target audience in mind. Who do they want to use their product / app?

- Procurement teams (buyers, category managers)
- Supply chain and production planners
- Finance and leadership for approvals and risk oversight
- Suppliers (for submitting quotes and updates)

2 What have you learned about the audience those products / apps are meant for?

- They need a simple and intuitive interface
- Real-time data and quick insights are important
- They value automation to reduce manual work
- Trust, data security and transparency are key

3 Did the developers do a good job communicating that?

- Yes, the apps clearly highlight benefits like cost savings, efficiency and better supplier collaboration.
- Use clean visuals, real-world metrics and industry terms (automotive, manufacturing, supply chain) to connect with the audience.

4 Judging from the screenshots or preview video, do you think the products / apps are appropriate for their intended audiences?

- Yes, most apps are well designed for enterprise users with clear navigation and relevant features.
- However, some feel complex for new users, so there is an opportunity to make it more user-friendly and focused on key tasks.

Empathize & Define

Go Further

For your product/ app idea, create a persona for each type of person who would use the product / app. Duplicate this page to outline each persona.

What does this person do?

Procurement Manager at an automotive manufacturer.

How old is the person?

35 years old.

Why is the person using the product/ app?

To analyze supplier risk, get real-time insights and make better procurement decisions.

Does the person prefer pictures or words?

Prefers visuals like charts, dashboards and simple summaries.

How often does the person use their product/app?

Daily (multiple times a day).

Include other details.

- Works in a fast-paced environment
- Handles multiple suppliers and categories
- Values accuracy, speed and reliability
- Uses laptop and mobile devices

Arjun

Procurement Manager

Automotive Manufacturing

Chennai, India

5+ years experience

“

I need the right supplier insights at the right time to keep production on track.

”

Reiterate

Focus

Before you commit to your product/ app, go back and review your list of product/ app ideas. Which ones seem most interesting? Focus on a few ideas for further brainstorming. What purposes do they serve and how do they solve issues? Who are the audiences? Write products/ app statements to clearly define each products'/ app's purposes. This can help you decide whether they're good ideas or not. Compare your new ideas to your similar product / app idea. Is it still your favorite?

What will your product/ app do?

My product/ app will ...

- Analyze supplier risks using AI.
- Provide real-time alerts and insights.
- Help procurement teams make faster and better decisions.

What will your product/ app do?

My product/ app will ...

- Provide a simple dashboard to monitor suppliers and risks.
- Integrate data from multiple sources (supplier, market, logistics).
- Suggest actionable recommendations.

What will your product/ app do?

My product/ app will ...

- Be user-friendly and accessible on web and mobile.
- Allow teams to track supplier performance and key metrics.
- Send early warning alerts for potential disruptions.

Why does this need exist?

because ...

- Supply chain disruptions can cause production delays and high costs.
- Current tools lack real-time risk prediction for the automotive industry.
- Companies need a centralized, easy-to-use solution for supplier risk management.

Why does this need exist?

because ...

- Procurement teams spend a lot of time collecting and analyzing data manually.
- They need quick, reliable insights to reduce risks and save time.
- Better visibility leads to more resilient and cost-efficient supply chains.

Why does this need exist?

because ...

- Many existing tools are complex and not tailored for automotive needs.
- Users need a solution that is simple, visual and actionable.
- Early alerts can help prevent major disruptions and ensure smooth production.

Empathize & Define

Go Further

For your product/ app idea, create a persona for each type of person who would use the product/ app. Duplicate this page to outline each persona.

To truly understand and serve our users, we must step into their shoes, listen actively, and immerse ourselves in their experiences

Engage with a diverse group of audience to capture varied experiences: Procurement managers, buyers, suppliers

Take detailed notes of audience interactions and feedback: Supplier comparison, risk alerts, usability feedback

Highlight key pain points, needs, and emotions: Scattered data, late risk alerts, time pressure

Stay connected with audience for continuous feedback: Regular updates and follow-ups

Avoid yes/no questions to gather detailed insights: Ask open-ended questions about challenges and workflow

Reflect on the empathy process and seek ways to enhance it: Improve based on user feedback

Empathize & Define

Search the Marketplace/ App Store for similar products/ apps. Look at user reviews to get ideas about how to make a better design or to discover features that would be nice to have.

My product/ app idea

From your brainstorming list, select one product/ app idea and try to write a purpose statement for your product/ app using the template below.

My product/ app will help [audience] with [opportunity, problem, challenge] by [what the app will do].

ProcurAgent will help **procurement teams** with **supplier risk management** by analyzing supplier, quotation, inventory and production data to provide **early risk alerts** and **recommend the best actions** for informed decision-making.

Get more specific about your product/ app idea. Write down any goals for your product/ app and describe what someone would do with it.

Goals for ProcurAgent:

- Help users identify procurement needs from BOM, production and inventory data.
- Compare suppliers and quotations easily.
- Predict supplier risks and provide early warnings.
- Recommend suitable actions to mitigate risks.
- Support negotiation and approval with clear insights.
- Continuously monitor supplier performance.

- ✓ Smarter Procurement
- ✓ Lower Risk
- ✓ Better Decisions

Empathize & Define

Purpose

Go Further

- If required, the process flow can mention detailed steps to facilitate a thorough understanding.
- If required, the process flow can mention each stage in detail to ensure comprehensive guidance.
- If required, the process flow can mention the key checkpoints and actions needed for successful completion.
- If required, the process flow can mention any contingencies or alternative steps to cover potential scenarios.
- If required, the process flow can mention additional details to support efficient implementation.

The Process Flow

After finalizing the problem statement, the process flow serves as a critical blueprint for the development of applications, providing a clear and structured sequence of steps that ensures all aspects of the solution are systematically addressed. It helps identify key milestones, allocates responsibilities, and establishes timelines, thereby facilitating effective management. Additionally, the process flow outlines the interactions between various components, anticipates potential challenges, and incorporates feedback mechanisms, ensuring a cohesive and adaptable development process that aligns with the defined objectives and user requirements.

Customer Sales Pitch

A customer sales pitch is a structured and persuasive communication designed to present a product or service to potential customers with the aim of convincing them to make a purchase. (can duplicate the content whenever needed)

Identifying Needs and Priorities:

Need reliable and cost-effective suppliers, early risk detection, and uninterrupted component supply for production.

Assessing Current Solutions:

Current process is manual, time-consuming, uses scattered data and identifies risks only after issues occur.

Evaluating Fit and Value:

ProcurAgent fits well by combining supplier, quotation, inventory and production data to provide early risk alerts, smart recommendations and better decision support.

Solution Overview:

An AI-powered procurement assistant that analyzes supplier data, predicts risks, recommends actions and helps manage the entire procurement cycle.

Market Fit:

Designed for automotive manufacturers with complex supply chains and multiple suppliers, where timely procurement and risk management are critical.

Feedback and Questions:

Would ProcurAgent help your team identify supplier risks earlier and make faster, more confident procurement decisions?

BUSINESS MODEL CANVAS

Key Partners	Key Activities	Value Propositions	Customer Relationships	Customer Segments

EMPATHY MAP

EMPATHY MAP

1. What do they hear?
 - Management expectations
 - Supplier updates
2. What are they hearing others say?
 - "We need faster procurement"
3. What are they hearing from friends?
 - Industry best practices
4. What are they hearing from colleagues?
 - Supplier issues and delays
5. What are they watching and reading?
 - Market news, risk reports

1. Who are we empathizing with?
 - Procurement managers
 - Supply chain teams
2. Who is the person we want to understand?
 - End users of ProcurAgent
3. What is the situation they are in?
 - Managing multi-supplier procurement
4. What is their role in the situation?
 - Ensure timely, low-risk and cost-effective procurement

1. What do they do?
 - Analyze quotations and compare suppliers
 - Track orders and monitor performance
2. What are they do today?
 - Use spreadsheets and ERP
3. What behavior have we observed?
 - Reactive to supplier issues
 - Spend time on manual checks
4. What can we imagine them doing?
 - Use ProcurAgent for early risk alerts
 - Make faster, data-driven decisions

1. What do they need to do?
 - Source materials and select suppliers
 - Monitor supplier performance
2. What job do they want or need to get done?
 - Procure the right materials on time
3. What decisions do they need to make?
 - Choose suppliers, approve POs
4. How will we know they were successful?
 - No delays, lower risk, better cost

1. What do they see?
 - Supplier performance data
 - Market risks and disruptions
2. What do they see in the market place?
 - Increasing costs and supplier risks
3. What do they see in their immediate environment?
 - Multiple suppliers and large data
4. What do they see others saying and doing?
 - Companies adopting AI tools
5. What are they watching and reading?
 - Industry news and competitor moves

1. What do they say?
 - "We need reliable suppliers"
2. What have we heard them say?
 - "Risk visibility is important"
3. What can we imagine them saying?
 - "This will save time and prevent issues"

User Actions
Input and Product/
App State
Choose Features
Inclusion
UI/UX

Overview

The planning stage is when you figure out what your products/ app will actually do to achieve the purpose you outlined. You'll consider what actions a user might need and how user input could trigger something to happen in your products/ app. You'll also choose possible features and find out how to design your product/ app with inclusion in mind from the start.

The planning stage defines what PRISM will do to address inefficient and risk-prone automotive procurement by identifying users, their activities, required information, and workflow triggers.

It begins with inputs such as customer demand, BOM, inventory, incoming supply, and required dates to identify procurement requirements, shortages, and production impact.

It also defines core features such as supplier intelligence, RFQ and quotation management, risk assessment, decision support, negotiation, human approval, purchase execution, and continuous monitoring, while keeping important commercial decisions under human control.

Core workflow

Requirement → Planning → Supplier Intelligence → Risk Assessment → Decision → Negotiation → Human Approval →
Procurement → Monitoring

User actions in my product/ app

Based on your product/ app idea, list the different things a user will want to do in your product/ app. Add one user action in each box. Fill as many boxes as you need to for your product/ app. Some of the best products/ apps are very simple: They do only one thing, but they do that thing very well.

Features:

A user will need to

Create a procurement requirement

A user will need to

Send an RFQ to suppliers

A user will need to

Compare supplier quotations

A user will need to

Check supplier performance and reliability

A user will need to

Assess procurement risks

A user will need to

Review and approve procurement decisions

Plan

User Actions
Input and Product/
App State
Choose Features
Inclusion
UI/UX

User input and changes to my product's/ app's state

From the list you created on the User actions slide, identify ways users will interact with your product/ app. User actions — or inputs — might trigger changes in how the product/app looks or what the product/ app does. This is called the product/ app state: The user does something, then the product/ app does something in response. User input could include typing, tapping a screen, or moving the device. Changes to the product design might include updates to the user interface, adjustments to functionality, or enhancements to performance. This is the first step in the process of product development. Changes to the app state might include images or text appearing on the screen, calculations using input, or storage of information. This is the first step to coding your app.

User input

Eg: A user aims the camera at an insect and taps a button

Enter procurement requirement details

Eg: A user types the insect name into a search box

Send an RFQ to selected suppliers

Eg: A user presses a "new insect" button on the home screen

Supplier submits quotation

Eg: A user takes a picture of an insect

Approve procurement recommendation

Changes to the app state

Eg: A photo is taken and saved

A new procurement requirement is created.

Eg: Different insect results appear on the search screen

RFQ status changes to Sent.

Eg: A new screen with the camera opens

Quotation is stored and linked to the RFQ.

Eg: A new screen with several boxes to type information in pops up

Procurement status changes to Approved.

My app's features

Many features are available to help you design great apps. Look through the partial list below and add checkmarks for the ones you might need for your app. Are there any others not listed that you might need?

☐ Drag a checkmark next to features you want to consider using in your app.

☒ Keyboard
Allows typing input

☐ Camera
Captures and processes images

☐ Microphone
Captures and records audio

☒ Touchscreen
Allows users to interact through tap, swipe, and drag

☐ Gyroscope
Measures how the device is rotated

☐ Accelerometer
Measures how quickly the device is moving

☐ GPS
Locates the device longitude and latitude

☐ Bluetooth
Communicates wirelessly with other devices

☐ Map
Displays interactive maps

☐ Augmented reality
Places virtual objects that users can interact with in their world

☐ Speakers
Plays back audio

☐ Haptics
Provides feedback through vibrating the device (iPhone only)

☒ Machine learning
Analyzes information and categorizes it for further use

☒ Other
Web dashboard

☐ Other

UI/UX

Inclusive design in my product/ app

An inclusive product/ app is respectful in that it puts people first. It does this by presenting information and functioning in ways that everyone can access and understand. This is a process that you can continue to improve as you prototype and get user feedback.

Try to think about your product/ app through different perspectives. How will your product/ app support a wide variety of users?

- Clear and simple interface so users can easily understand the system.
- Readable text and clear labels for procurement, supplier, and risk information.
- Keyboard and touchscreen support for easy interaction.
- Clear alerts and status indicators so important information is easy to notice.
- Role-based access so users only see the functions relevant to their work.
- Accessible layout and navigation so users can move through the system easily.
- Human approval for important procurement decisions, keeping users in control.

Consider how to make your product/ app approachable and welcoming to all. What will you need to do so that users can fully access the [accessibility features](#) in your product/ app?

Drag a checkmark next to elements that you need to consider for your product/ app.

Cognitive Support

Use motion, fonts, color, and sound carefully to avoid sensory overload and to help people — including those with learning challenges — focus on what's important.

Accessibility Descriptions

Include alternative text for visual elements and accurately label buttons to provide context for people who are blind, have low vision, or use a screen reader.

Accessible Content

Add captions, transcripts, or sign language support for video or audio elements and haptic alerts for people who have hearing loss or want a silent device.

Alternate Input

Provide multiple ways to complete gesture-based (like swiping) or typing actions that can support someone with limited mobility.

Plan

User Actions
Input and Product/ App
State
Choose Features
Inclusion
UI/UX

UI/UX

A good product/ app should be easy to use. That's where the user interface (UI) design comes in. A well-designed UI makes for a good user experience (UX). Think back to the first time you used some of your products/ apps, or try using a new product/ app. What was the experience like? Did you get confused navigating them? Review elements such as material quality, ergonomic design, and the overall user interaction with the product. Even the smallest detail can significantly impact how someone experiences your product. Review elements like font size, icon shape and placement, and the navigation from screen to screen in app. Even the smallest element makes a difference in how someone experiences your product/ app. Be sure to review in Android Design Guidelines- <https://developer.android.com/design/>

Go back to your list of similar products/ apps and choose one to review. Think about the features that make it easy to use.

Review of similar product/ app

Review of Similar Product/App — SAP Ariba

- Dashboard: Shows important procurement information in one place.
- Navigation: Uses clear menus and sections for different procurement tasks.
- Tables: Organises supplier, RFQ, and quotation information clearly.
- Buttons & actions: Uses clear labels for actions such as creating, reviewing, and approving.
- Consistency: Keeps layouts and controls consistent across screens.
- PRISM takeaway: Use a simple dashboard, clear navigation, structured tables, and consistent action buttons.

Go Further

Now consider the rest of the list of your similar product/ apps. Rank them in terms of their UI design. Which products/ apps are easy to use and seem to just work? Write down the reasons that some products/ apps are easier to use than others. ~~One~~ ^{How} do you know what to

do immediately? How many steps did it take to start using the product effectively? How many taps did it take to get going on the app? (The answer should be 'very few'.) First impressions count. Compare your notes with other students. Did you agree on the reasons?

1.

Clear dashboard — Important procurement information is visible at a glance.

2.

Simple navigation — Users can move between procurement tasks easily.

3.

Structured tables — Supplier and quotation information is organised clearly.

4.

Clear action buttons — Actions like create, review, and approve are easy to identify.

5.

Consistent layout — Similar screens use consistent fonts, icons, and controls.

Overview

Building a prototype helps you figure out exactly how your product/ app will work and what the user experience will be. This section will guide you through the process of sketching out what a user will see and do in your product/ app and creating a unique style for it. You'll then build a Designing for product development or working prototype in UI/UX Tools (Figma for app development) so that you can test out your ideas before doing any coding for app development.

My product flow chart/ app's screens

Choose one user activity to prototype from the list you created on the User Actions slide.

User Activity: Review and compare supplier quotations for an RFQ

Describe the user activity in more depth.

1. User (Procurement Manager) opens the RFQ and views received quotations.
2. User compares suppliers based on price, delivery, risk and AI insights.
3. User selects a preferred supplier and proceeds for approval/negotiation.

Use pen and paper or a drawing app to sketch between one and three screens that show the user activity you chose.

My product's response to a user

There are two main categories of how the product state can change with user input:

Physical Interaction: Changes to the physical state, such as a part moving, a button being pressed, or a mechanism being activated.

Performance Output: Changes in the product's function, such as an improvement in efficiency, activation of a feature, or recording of user data.

Take a screenshot or diagram of the product layout or design blueprint and add it to this slide. Draw a box that corresponds to the type of change in the product state down to each user interaction in your blueprint. Draw lines to connect each user interaction to the box and write a short description of the change in the product state.

My app's response to a user

There are two main categories of how the app state can change with user input:

Onscreen:

Changes to the interface, such as a new screen, button, or text that appears.

Offscreen:

Changes to information behind the scenes, such as a calculation, saved user input, or a photo filter.

Take a screenshot of the outline for your app and add it to this slide. Drag a box that corresponds to the type of change in the app state down to each user input in your storyboard. Draw lines to connect each user input to the box and write a short description of the change in the app state.

Go Further

Try creating your own sounds from Garageband Add a new slide to create a mood board using screenshots that inspired your design. Read more about accessible use of color and contrast.

My product's/ app's design

Give your product/ app some style and personality. Remember to keep your product's/ app's purpose and audience in mind, and think about how your design choices can make your product/ app inclusive and accessible to your users.

Choose a color scheme.

Sketch details of user interface (UI) elements such as buttons, navigation tools, or other visuals. If your product/ app uses color to show information, sketch features/ icons to support colorblind users, too. Then take pictures and add them below.

For each visual UI element, practice writing alternative descriptions for a person who's blind by selecting the image, clicking or tapping the Image tab in the Format sidebar, and adding text to the Description field.

What fonts will your app use?

Poppins – for a clean, modern and readable UI (Headings & Body).

Add sound files or describe the sounds your app will use to notify users of something, immerse them in a game atmosphere, or enhance the app's mood.

Notification sound – subtle chime for important updates (e.g., new quotation, approval).

Success sound – soft tone when an action is completed.

6. SourceSync

Prototyping in UI/UX Tools

1. **Set Up Your Document:** Create a new project and set the canvas size to match your target device or screen.

2. **Design Elements:** Choose colors and fonts. Design navigation buttons and other UI elements.

3. **Create Screens:** Design each screen on a separate artboard or frame.

4. **Add Interactions:** Use the tool's prototyping features to create links between different screens.

5. **Set Transition Effects:** Choose transition types and configure animation settings.

6. **Test Your Prototype:** Enter the presentation or preview mode to test interactions and transitions.

7. **Share Your Prototype:** Share a link to your prototype with stakeholders for feedback.

8. **Iterate and Refine:** Gather feedback and make necessary adjustments.

As you refine your product, consider aligning your design with current industry standards and best practices. This will ensure that your product not only meets user expectations but also adheres to proven design principles that enhance functionality and user experience.

As you experiment with your own UI, you might also want to design apps that match the iOS/android design language.

For each version of your prototype, think about the following:

For Product

- Can users choose to interact with the product in different ways?
- Can you present the same information in different formats?
- What's the first experience (view) users encounter with the product? What features or controls are immediately visible? What follows after?
- How many interactions will it take for users to access essential information or features?
- How will users move between different parts or features of the product?
- What are some effective ways to convey the product's features without relying on text?

For App

- Can users choose to engage with the content in different ways?
- Can you provide different representations of the same data?
- What's the first screen (view) that the user sees? Which buttons are visible? Then what happens?
- Decide what kinds of graphics and icons your app will display and where they'll appear.
- How many taps will it take for users to find out what they need to know?
- How will users navigate between views?
- What are some simple ways to communicate the features of your app without using words?

Deeper Dive: Detailing MVC

Once you've defined how your app will flow in your prototype, think about how to organise different parts of your code. The MVC pattern helps accomplish this while keeping your code organised.

App Development: Use the following questions to help build a list of models, views and controllers that your app would need if you began building the prototype with code.

Models

What data do you need to build your features? Where does the data come from? Does the user supply it or does it come from a web service? Do you need to store the data on the device for offline access?

 User • id, name • email • role (buyer/supplier) • organisation	 RFQ • id, title • description • category • status • createdBy • deadline	 Supplier • id, name • contact details • company info • certifications • rating	 Quotation • id, rfqId • supplierId • amount • validity • status	 PurchaseOrder • id, rfqId • supplierId • items • totalAmount • status
---	---	--	---	---

Views

Are there particular views you want to show on multiple screens? Did you include any customised gestures?

 Login / Sign Up	 Dashboard	 Create RFQ	 View Quotations	 Supplier Profile	 Notifications
---	---	--	--	--	---

Controllers

How many view controllers does your app need? What controllers will help manage the data? Does your app have customised transitions that need a controller?

 AuthController • handle login/signup • manage user session	 RFQController • create, edit, delete RFQs • fetch RFQ list	 SupplierController • manage supplier data • search & filter suppliers	 QuotationController • handle quotations • compare & select	 NotificationController • manage alerts • real-time updates
--	--	---	--	--

Prototype

Storyboard

Refine App Behavior

Design Style

Build

App Icon and Name

**Models, Views &
Controllers**

What sections of your app might you want to write code for first? Outline a plan for building your app. Look back at your storyboard.

Which views are most important and need to work first?

Build Order

- | | |
|--------------------------------|---|
| 1 Authentication & Role Access | 4 Quotation Comparison & Price Intelligence |
| 2 Supplier / Product Master | 5 Risk & Monitoring |
| 3 RFQ & Quotation Management | 6 AI Recommendation & Approval |

Which views might you want to save to build at the end?

Views to Complete & Save

- | | |
|-------------------------|--------------------------------|
| 1 Procurement Dashboard | 4 Risk & Monitoring Dashboard |
| 2 RFQ & Quotation Views | 5 AI Decision / Recommendation |
| 3 Supplier Comparison | 6 Negotiation & Approval |

Core MVP views saved as the final prototype.

Pitch with Mentors/ Industry/ Alumni/ SNS 15/ CFs

Pitch with Mentors/ Industry/ Alumni/ SNS 15/ CFs:

When pitching your product/ app development idea to mentors, industry professionals, or alumni, it's important to approach it with a strategic and professional mindset. Here's a guide to help you prepare and deliver an effective pitch

- Research and Preparation- Know Your Audience, Prepare Your Pitch Deck & Practice Your Delivery
- Problem Statement- State the Purpose, Define the Problem & Highlight the Impact
- Solution Overview- Present Your Product/ App, Showcase Value, Execution Plan & Explain the Business Model
- Feedback and Next Steps- Be Concise and Focused, Ask for Feedback & Discuss Next Steps

Refine the product/ app as needed to ensure it meets the highest standards and addresses user needs effectively.

Brand the impact with story in LinkedIn/yTube followed by preparing a Case Booklet- It is a comprehensive document that outlines the rationale, planning, and execution details. It serves as a reference guide and a strategic tool throughout the development process. A case booklet helps ensure that all aspects of the product/ app development are thoroughly planned and documented, serving as a roadmap for the project and a reference for stakeholders.

Evaluate

Product/ App
Pitch
Prepare
Observation
Interview

Overview

All right, you have a working prototype! Now it's time to get some feedback. Though you have only a partial product/ app, it's good to test often. Have your classmates, family, and others try it. Try to find testers who fit your product's/ app's target audience and pitch them your product/ app. Then plan to observe users as they try the prototype and get their feedback.

Evaluate

App Pitch
Prepare
Observation
Interview

My product/ app pitch

One way to test your product/ app idea is to develop a pitch and share it with others. Make a three-minute presentation or video of your pitch. A good pitch will tell a strong and clear story that makes people want your product/ app.

Your pitch should include:

- **Why:** The problem your product/ app is trying to solve
- **Who:** A description of who your product/ app is for
- **What:** An overview of the product/ app or a demonstration of the prototype
- **How:** Details about user experience and user interface, including the design, features and improvements you've made

What feedback did you receive about your product/ app idea?

Smarter Procurement. Brighter Decisions.

Why?
Procurement is often slow, fragmented and non-transparent. PRISM solves this by digitising and streamlining the entire procurement process.

Who?
Government departments, institutions and organisations that manage procurement of goods and services.

What?
A web platform to create RFQs, manage suppliers, compare quotations, and track purchase orders with real-time insights.

How?
A clean and intuitive interface with role-based access, automation, analytics and notifications to improve efficiency and accountability.

Feedback Received

 "Very useful and relevant. Can save a lot of time in the procurement process."

 "The dashboard and analytics feature looked impressive."

 "Suggested adding mobile support and more filters in supplier search."

 "Overall a strong idea with real impact. Consider integrating with government systems in the future."

Evaluate

App Pitch

Prepare

Observation

Interview

Prepare a test for your prototype

Another way to test your prototype is to develop a test for users to try out. Prepare a plan for a user to test out your prototype.

Describe the activity you want your tester to accomplish with your prototype. Think about what you'd like feedback on and tested.

Test Activity

Ask users to go through the main flow of PRISM:

- 1 Sign up / Login
- 2 Browse and create an RFQ
- 3 Add suppliers and compare quotations
- 4 View AI insights / recommendations
- 5 Track status and notifications

Write a script that you'll read to your testers to introduce the task and product/ app. Try using a part of your product/ app pitch to help write this script.

"Hi! Thank you for taking the time to test PRISM.

PRISM is a procurement management platform that helps government departments and institutions create RFQs, compare quotations from multiple suppliers, and make data-driven decisions.

Today, I'd like you to try a few key features and share your thoughts as you go. There are no right or wrong answers — your honest feedback will really help us improve the product. Let's get started!"

How many people will you test with?

5
users

How will you reach out to people so that you can test with a diverse group?

Reach out to
government department
contacts

Send email
invitations

Share with different
roles (procurement
officers, admins, suppliers)

Use college/ professional
networks and online
communities

Evaluate

App Pitch

Prepare

Observation

Interview

Observation of someone using my product/ app

Use your evaluation plan from the Prepare slide to test your prototype. Describe a goal you want them to achieve, then watch them try to accomplish the task. Ask them questions and record their answers.

Did the user know what button to tap?

Yes, the user quickly identified the "Create RFQ" button on the dashboard. They mentioned the label was clear and easy to understand.

Did the user know how to use the interface?

Yes, the user was able to navigate through the menus, fill in the required fields and move between screens without much guidance. The interface felt intuitive to them.

Was the user ever confused? At what point?

The user was slightly confused about the difference between "Save Draft" and "Submit" while creating an RFQ. A small tooltip or description could help here.

Did the user enjoy the product/ app?

Yes, the user found the app useful and appreciated how it simplifies the procurement process. They liked the clean design and real-time comparison feature.

Did the user smile or laugh at specific points?

Yes, the user smiled when they saw the AI recommendations for the best supplier. They also commented that the dashboard looked "really good".

Did you observe anything else?

The user suggested adding a filter for location and the ability to download comparison reports. Overall, they felt the app could save a lot of time for their team.

Evaluate

App Pitch
Prepare
Observation
Interview

Interview

Interview the user when they finish testing your product/ app to better understand their experience. Here are a few questions to get you started.

What did you like and not like about the product/ app?

Liked

- Clean and simple interface
- Easy to create and manage RFQs
- Helpful comparison of quotations
- Useful dashboard and analytics
- Saves time in the procurement process

Not Liked

- Some terms (e.g., Draft/Submit) were confusing at first
- Would like more guidance/tooltips
- Wanted faster filters for suppliers
- Felt the initial setup could be shorter

Is the product/ app useful? Would you use an product/ app like this?

Yes, it is useful

"Yes, I would definitely use this. It makes the procurement process more organised and transparent. It can help our team compare suppliers quickly and make better decisions."

What else might you want to see in this product/ app?

Suggestions

- Mobile app for on-the-go access
- More advanced filters (location, category, certifications)
- Export comparison reports (PDF/Excel)
- Notifications and reminders for RFQ deadlines
- Integration with government procurement portals
- AI-based supplier recommendations

Empathize

Purpose
Ideas
Audience
Focus
Reiterate

Reiterate

Remember, this is a design cycle and it's time to go back to the brainstorming stage. As you repeat the design cycle, think about what you learned from your evaluation. Did problems come up, and if so, how can you fix them? How can you improve your product/ app? Another important question to ask yourself is whether you're still excited about your product/ app idea. If not, it might be time to go back to your list. Not all ideas pan out. One objective of the design cycle is to help you test concepts and determine what's worth pursuing. Do you still want to continue with your idea? If so, write the name of your product/ app below, give it a star rating and write an product/ app review.

Smarter Procurement. Brighter Decisions.

After testing and feedback, I still want to continue with PRISM. It addresses a real problem in government procurement by making the process more transparent, efficient and data-driven. The prototype helped us identify key improvements like better filters, clearer navigation and enhanced AI recommendations, and I am excited to keep iterating and build a more complete and impactful solution.

Review of my product/ app

PRISM is a promising solution that simplifies government procurement by bringing suppliers, quotations and decision-making into a single, easy-to-use platform. The interface is clean and intuitive, and the AI-based insights add real value by helping users compare options and make better decisions. While there is still room for improvement (such as mobile support, more advanced filters and detailed analytics), the prototype already shows strong potential and received positive feedback from users. Overall, PRISM can make procurement more transparent, efficient and accessible, and I am excited to continue developing it.

— Team PRISM

Go further

Revisit the criteria you noted in the Purpose topic for what makes a product/ app great then answer the questions to the right.

Continue to revisit the different topics throughout the design cycle. Revise your prototype accordingly, testing and retesting until you have the next great product/ app.

Is your product/ app innovative?

Yes, PRISM is innovative because it brings a simple, AI-powered platform to help government procurement more transparent, efficient and accessible. It uses real-time data, smart matching and an intuitive interface to solve a problem that is still mostly manual and fragmented.

Does it do something that existing product/ apps don't do?

Yes, unlike existing systems, PRISM combines real-time tender updates, AI-based supplier matching, and end-to-end tracking in one platform. It also offers a user-friendly interface with data insights and notifications, which most current systems lack.

Is it a product/ app someone would use over and over again?

Yes, procurement involves continuous tenders, updates and follow-ups. PRISM provides daily value through real-time notifications, easy tracking, and useful insights, making it a tool users would return to regularly.

How can you improve your product/ app?

I can improve PRISM by adding features like AI-based query chat, mobile app support, multilingual support, and integration with more government portals. I can also make the dashboard more customizable and add advanced analytics to give deeper insights for decision-making.

Brainstorm

Plan

Prototype

Evaluate

Reiterate using feedback

Now it's time to reflect on your product/ app. Ask yourself what's exciting about your product/ app idea. If nothing comes to mind, try returning to your list on the [Ideas](#) slide. Not all ideas work out.

What's exciting about your product/ app idea?

PRISM is exciting because it solves a real-world problem by making government procurement more transparent, efficient and data-driven. The use of AI for supplier matching and insights can significantly reduce manual work and help departments make better, faster decisions.

If you decide to continue with your original product/ app idea, think about what you learned from your evaluation. What did your product/ app do well? What could you improve?

PRISM did well in providing a clean and intuitive interface, helpful search and filtering options, and useful comparisons of suppliers and quotations. Users appreciated the clarity and time saved in the procurement process. We could improve by adding more advanced filters (e.g., location, category, certifications), providing AI-based recommendations, and including a mobile app for on-the-go access.

Think about what you'll do next. Do you want to iterate on and improve the feature you designed? Are you ready to design the next feature of your product/ app? Or do you want to do both?

I want to do both. I will first iterate on the existing features based on user feedback, such as improving filters and adding AI recommendations. Then, I will design the next feature — a mobile app version with real-time notifications, so users can track tenders, updates and deadlines easily.

App Pitch

You've tested and improved your product/ app idea. Now it's time to polish it up and share it! Make a three-minute presentation or video of your pitch. A good pitch will tell a strong and clear story that makes people want your product/ app.

Your pitch should include:

- Why: The problem your product/ app is trying to solve
- Who: A description of who your product/ app is for
- What: An overview of the product/ app
- How: Details about the UX and UI, including:
 - The design
 - The features
 - The coding concepts it uses
 - The prototype and any visuals
 - Improvements made based on user testing

ACKNOWLEDGEMENT

SNS Design Thinking Playbook

The SNS Design Thinking Playbook is a comprehensive guide, meticulously developed with inspiration from two key resources: **the App Journal by Apple** and the **Design Thinking Educators Toolkit by IDEO**. These resources have been instrumental in shaping the structure, methodologies, and approach of this playbook, ensuring it meets the needs of modern developers, designers, and innovators. By combining the practical insights from **Apple's App Journal**—a resource known for its user-focused strategies in app development—and the human-centered principles from **IDEO's Design Thinking Educators Toolkit**, the playbook achieves a unique balance between technical expertise and empathetic design.

Together, these resources have helped create a playbook that is not just a guide but a transformative tool for tackling modern challenges, driving innovation, and building solutions that resonate with users.

SNS Design Thinking Playbook

Key Phases

SNS Design Thinking Playbook built on the foundation of modern design methodologies, technological advancements, and the shared insights of countless industry professionals. This playbook emphasizes the need for **Continuous Iteration, Collaboration, and a User-Centered Approach**—principles that are critical in navigating today's fast-paced technological landscape. It underscores the importance of aligning technical expertise with a deep understanding of user needs, ensuring that applications are not only **functional but also intuitive, scalable, and impactful**.

The **SNS Design Thinking Playbook** also acknowledges the evolving nature of technology. With every iteration, new challenges emerge, and with them, new solutions. This book serves as a **dynamic resource**, intended to grow with its readers as they encounter these challenges and innovate further.

With its focus on practical application and fostering innovative thinking, this playbook is positioned to drive the future of **app/product development** forward.
